## LF1400NN: Lube Filtration Flyer

**Evolutionary Filtration.**  
 Today's Cummins engines face higher pollution and more severe operating conditions than ever before. Job site conditions can also extend to more diverse and more complex operating conditions and are often unrelenting. You have the latest in filtration technology - the NanoNet media - to meet these challenges.

**Always Guarded of Filtration.**  
 Filtration is the most important component of your engine's protection. NanoNet media is the most advanced filtration technology available. It's the only media available that provides the protection you need for your Cummins BX engine.

**Summary of the NanoNet:**  
 Lube filters are challenged with three main factors:  
 • Capture and retain contaminants to keep the engine clean  
 • Allow for high efficiency throughout the filter's life  
 • Improve media ability for critical engine protection, such as oil and fuel filters, to ensure engine performance

Fleetguard's NanoNet media is the most advanced filtration technology available. It's the only media available that provides the protection you need for your Cummins BX engine.
